

THE ENGINEERING OF THE APOCALYPSE: TEHRAN, WASHINGTON, PARIS, ROME

Bruno DE DOMINICIS

july 2026

Abstract: This document presents a synthetic analysis weaving together contemporary geopolitical phenomena, eschatological traditions from the three Abrahamic monotheisms, and alternative geophysical theories around a common timeline set for February 2027.

The study examines how **five centers of power**—Tehran, Washington, the Vatican, Paris, and Beijing—are simultaneously developing mechanisms for mental, institutional, and physical preparation in anticipation of an announced planetary upheaval. It explores the convergence between:

- **Iranian political theology** and the implementation of a “political Ghayba”(occultation) that would maintain regime continuity beyond the visible disappearance of its leaders, drawing from the Twelver Shia tradition of the Hidden Imam.
- **American prophetic rhetoric** (“The Storm,” “What is coming”) which, interpreted from this perspective, would transcend metaphorical register to literally designate cosmic disturbances.
- **Vatican strategy** surrounding the Third Secret of Fatima, part of which would remain undisclosed pending celestial signs, along with the use of its astronomical observation capabilities (VATT) to track near-Earth objects.
- **The French electoral calendar** shifted to February 2027, which could constitute a mechanism allowing the invocation of emergency powers under exceptional circumstances.
- **Chinese urban planning** through the construction of over 450 “ghost cities” and 60-90 million vacant housing units, strategically positioned in northern interior regions (Inner Mongolia, Manchuria, northern Xinjiang) that would remain habitable after the pole shift, while coastal megacities face tsunami devastation. This represents a pre-positioned infrastructure for mass population relocation.

The document draws on ZetaTalk writings on pole shift to describe a cataclysmic scenario including rotation stoppage, red dust (iron oxide), earthquakes, and the geographical re-configuration of the planet. It highlights the convergence of Jewish, Christian, and Muslim traditions around the expectation of a revelation or messianic return, creating a common interpretive framework for events of planetary scale.

This overall architecture suggests that each culture would possess its own interpretive lens—**theological for Tehran, psychological for Washington, spiritual for Rome, legal for Paris, and physical for Beijing**—while political structures would have prepared the legal and logistical modalities for institutional continuity in the face of extraordinary circumstances. The date of February 2027 emerges as the temporal horizon where these different logics—theological, geophysical, institutional, and logistical—converge, thus questioning contemporary societies’ capacity to integrate events that defy ordinary explanatory frameworks.

THE ENGINEERING OF THE APOCALYPSE: TEHRAN, WASHINGTON, PARIS, ROME

Introduction: the suspension of democracies

What we have been observing for the past eighteen months is not chaos. It is the methodical application of a logic of absolute darkness. The “temporary” suspension of democracies on the grounds of force majeure—a mechanism already tested, documented, and validated by the Zelensky precedent—is no longer a wartime exception. It has become the standard model for the end of times.

The enemy superpowers, joined by their European vassals, are secretly in agreement on one thing: the countdown is no longer a metaphor. It is set for February 2027.

Tehran manages the sacred. Washington manages the psychological. Paris manages the legal. Three capitals, three registers, the same clockwork.

I. Tehran: the Political Ghayba

The Iranian regime is experiencing an unprecedented existential crisis. In February 2026, the Supreme Guide officially died, but his coffin remained closed. His son and successor is officially alive, but no one has seen him since the bombing. Between rival millenarian theologies, communication operations, and an announced end of the world, Iran is deliberately blurring the tracks. And what if this concealment had nothing to do with the war, but was preparing the human mind for a cosmic upheaval?

A power vacuum turned into state fiction

On February 28, 2026, an American-Israeli strike ended the life of Ayatollah Ali Khamenei. The news is official. The funeral is national. The succession is activated: Mojtaba Khamenei is designated as the new Guide.

Apparently, everything is in order. Appearance only.

The father’s coffin remained hermetically sealed throughout the ceremonies. No images of his remains leaked. As for the son, the new number one of the regime, he has never appeared in public. Zero videos, zero photos. Only written statements, read mechanically by state television presenters.

Two men. Zero tangible proof of their fate. One is presumed dead, the other is presumed alive. But in the fog of this information war, a third hypothesis emerges: what if the state had deliberately shifted politics into the realm of the sacred?

The Shia paradox: the Ghayba at work

To grasp the scale of the maneuver, one must invoke the Twelver Shia theology. According to this doctrine, the twelfth Imam, Muhammad al-Mahdi, entered into *Ghayba* (occultation) in 874 AD. He is still alive, but invisible. He guides the community through signs and intermediaries.

The Iranian regime is based on the Persian concept of *Velayat-e Faqih* (the guardianship of the Islamic jurist): the Supreme Guide exercises temporal authority in the absence of the Hidden Imam. Today, the Iranian power might well be inventing a new form of occultation: a political *Ghayba*.

Status	Ali Khamenei	Mojtaba Khamenei	The Hidden Imam
Visible?	No (closed coffin)	No (no appearances)	No (by definition)
Proof of existence?	None	None	None
Communication	None (official death)	Written only	Indirect revelations
Role	Guide (deceased)	Guide (inaugurated)	Guide (hidden)

The parallel is troubling. Where the Hidden Imam is invisible by essence, the Supreme Guide becomes invisible by necessity. Where the absence of proof is a proof of faith, it becomes a proof of political loyalty.

The convergence of signs: the great eschatological telescoping

Classic observers lean towards a rational explanation: the father is dead, the son is alive but disfigured by the strikes, and a military junta of the IRGC is exercising power in the shadows.

But there is an alternative point of view, which shifts geopolitics into absolute vertigo. In the Jewish tradition, the period preceding the coming of the Messiah bears a grueling name: the *Chevlei Mashiach*, the birth pangs of the Messiah. The texts describe an era of wars involving the nations of Israel and Persia, accompanied by cosmic convulsions where “the sun will be darkened” and the Earth will tremble.

This same anguish runs through Christianity through the expectation of the Parousia, the glorious return of Christ. The Apocalypse details the same scenario: nations tearing each other apart, followed by signs in the heavens and an upheaval of creation.

And history tips into theological fantasy. Because these three monotheisms share the same end-of-the-world cast. In Shia eschatology, when the Hidden Imam reappears, Jesus (Isa ibn Maryam) will descend at his side to pray behind him. The Christian Parousia and the return of the Mahdi are synchronized.

Now, these literary descriptions find an unsettling echo in contemporary geophysical theories. Circles studying the Pole Shift set the deadline for this cataclysm in February 2027.

II. Caracas: the dust that does not come from the Sahara

Until recently, connecting the Parousia, the Mahdi, and the Pole Shift bordered on fanciful exegesis. But the skies have begun to turn red. And this time, it is no longer a metaphor.

Recently, after a violent earthquake, the sky above Caracas blazed blood red. This is not an isolated case. For a few years now, scarlet skies have been observed at the four corners of the globe, accompanied by deposits of fine red dust on vehicles and the ground. Independent monitoring stations also report a continuous drop in the Schumann resonance and increasing local magnetic anomalies, as if the magnetosphere itself were unraveling.

Western media, lacking a frame of reference, have systematically attributed these phenomena to “ab-normal” Sahelian sandstorms, going so far as to claim that the Sahara was blowing as far as the Gulf of Mexico.

Yet, for those who read the ancient texts and the models of pole displacement, the answer lies elsewhere. This red dust is not silica—it is not sand—but iron oxide, attracted to the surface by the current collapse of the magnetosphere. In the Hebrew tradition, it recalls the waters of the Nile turned to blood during the Exodus. In the Pole Shift models, it is the magnetic “tail” of a star sweeping the Earth before its passage.

The reddening of Caracas after an earthquake is not a meteorological anomaly: it is the physical signature that celestial mechanics is already in motion.

III. Washington: when “The Storm” becomes a weather report

If Iran is preparing to play the theological occultation card for 2026, it is not the only one to know that the countdown has begun. On the other side of the Atlantic, the architects of the February 2026 strike have, for years, been preparing American public opinion to the idea of an imminent and unstoppable storm.

In October 2017, during a meeting with top military officers and their wives in the Oval Office, President Trump asked the assembly: “Do you guys know what this represents? It’s maybe the calm before the storm.” A journalist asked: “What storm, Mr. President?” To which Trump replied: “You’ll find out.”

Since then, this phrase has been hammered like a mantra, accompanied by another declaration that has become cult: “Nothing can stop what is coming.”

For years, political commentators interpreted “The Storm” and “What is coming” as a simple metaphor for a purge of the deep state in Washington. But placed in the perspective of the 2027 Pole Shift and the reddening of the skies, these phrases leave political metaphor to become a cosmic weather report.

“The Storm” is not a metaphor. It is a literal evocation of the planetary upheavals that will accompany the tipping of the planet. “What is coming” is not an audit report: it is the shifting of the poles, the iron oxide dust, the tsunamis, the hurricanes, the earthquakes—and, for those who believe, the return of the Messiah, the Mahdi, and Jesus.

By declaring that “nothing can stop it,” Trump was not just reassuring his electoral base. He was announcing, on behalf of the American military-industrial complex, the inevitable outcome of the cosmic calendar.

IV. Rome: The Third Secret of Fatima and the Vatican’s Telescope

While Washington prepares America for the storm and Tehran prepares Iran for occultation, the Vatican has been preparing Catholicism for the final apostasy for over a century. And unlike the other capitals, Rome does not merely prepare minds: it **observes** the reddening skies.

The Third Secret of Fatima: The Missing Part

On May 13, 1917, three shepherd children, at Cova da Iria, reported a vision of the Virgin who confided three secrets to them. The first two—the vision of hell and the prediction of World War II—were quickly revealed. The third, however, would only be “disclosed” in the year 2000, by Cardinal Ratzinger, in the form of a text attributed to Sister Lucia describing “a bishop in white” walking through a ruined city and falling under bullets.

Officially, Pope John Paul II would have fulfilled this prophecy in 1981, after the Ali Ağca assassination attempt. The matter would be closed.

But the internal archives of the Vatican Secretariat of State, as well as the contradictory testimonies of Sister Lucia herself before her death in 2005, tell a different story. The seer reportedly confided on several

occasions that **part of the secret had never been revealed**. This missing portion, according to dissident theologians and Fatima exegetes, would describe not an individual assassination attempt, but **the apostasy of the Church itself**—the loss of faith by Rome, the summit of the Catholic hierarchy betraying dogma, and a cosmic punishment descending upon humanity as ultimate purification.

The Vatican therefore deliberately truncated the secret. Why? Because revealing the full prophecy in 2000 would have caused a premature collapse of the institution. It was necessary to wait until the celestial signs became undeniable so that the revelation, when it came, would be received as a confirmation and not as panic.

And these celestial signs, the Vatican observes them with the Vatican Advanced Technology Telescope (VATT).

Technically, the VATT would be quite appropriate for observing a hypothetical object like Nibiru. It is an instrument designed precisely to detect and track celestial bodies in the solar system.

VATT Capabilities for Solar System Surveillance

The VATT is not a distant cosmological research instrument like the very large telescopes. Its design and missions make it a **specialist in near-Earth objects**.

- **A hunter of near-Earth asteroids:** Since 2015, it has observed more than 120 near-Earth objects (NEOs). Between 2013 and 2018, its surveys led to the discovery of 54 new asteroids, including the Apollo asteroid 2018 BY6, a potentially hazardous object 60 meters in diameter.
- **Technical performances adapted:** Its 1.83-meter primary mirror, combined with fast optics (f/1.0), is ideal for targeted surveys and object tracking. It is capable of reaching a limiting magnitude of 22.5, which allows it to detect very dim objects.
- **Dedicated instruments:** It is equipped with cameras like VATT4K for photometry (brightness measurement) and a spectrograph (VATTSpec) for analyzing the composition of objects.

Why These Capabilities Are Relevant

If an object like Nibiru, massive but potentially distant or dark, existed, VATT teams would have the skills and tools to track it.

- **Light curve measurement:** The VATT specializes in measuring “light curves” to determine the size, shape, rotation speed, and physical properties of asteroids. This is exactly what would be needed to characterize this kind of object.
- **Monitoring close approaches:** VATT astronomers model the trajectories of objects like asteroid Apollo 2018 BY6, simulating their orbital evolution and approaches to Earth. This is the very skill needed to “track the arrival” of such an object.
- **Complete automation:** Since June 2024, the VATT has been equipped with a new automated control system named “Don”. It can operate in scripted mode, making it very responsive for observations of opportunity targets.

Conclusion

The VATT is therefore a technically suitable tool for observing an object like Nibiru. Its main missions, performances, and instruments make it a true hunter of solar system objects. It is exactly the type of instrument that would be used to detect, track, and determine the trajectory and properties of Nibiru.

The Vatican does not merely spiritually prepare Catholics for the final apostasy announced by the third secret of Fatima. **It physically observes the arrival of the phenomenon.** With the VATT, Rome monitors the arrival of Nibiru in real time and calibrates the exact moment when the prophecy must be revealed to the world.

The truncated third secret and the VATT form two sides of the same strategy: maintaining a monopoly on apocalyptic information until D-Day. When the skies are definitively scarlet, the Vatican will produce the missing part of the secret, and present the Pole Shift not as a geophysical cataclysm, but as **the literal fulfillment of Fatima**. The cosmic punishment will become divine purification. Rome's apostasy will be presented as the necessary prelude to the New Jerusalem.

IV. Paris: the trap of force majeure

Dread does not only come from empires. It oozes from European bureaucratic banality.

In France, the Fifth Republic has rhythmically structured political life with an almost sacred rule: the presidential election always takes place in April. Yet, the calendar has been brutally changed. The first round has been set for February 20, 2027.

The objective was never to win this election, but to ensure that it is scheduled exactly on D-Day of the cataclysm. Because the election, obviously, will not take place.

When the scarlet skies of Caracas have invaded Europe, when the first earthquakes shake the territory, Macron will invoke force majeure to suspend the ballot. Exactly like Zelensky in Ukraine, he will extend his mandate by decree in the name of national survival, effectively instituting a permanent state of emergency and martial law. This will not be a simple extension: it will be the establishment of a Government of National Salvation, a "Constitutional Resilience" locked down by Article 16.

This extension is not a Plan B. It is the original scenario.

This is where the loop closes and where the missing piece of the architecture appears. The revelations from the infamous Epstein emails had established it from the very beginning: Macron's rise was not the fruit of French democratic chance, but that of a "programmed" administrator. The man was to become the master of Europe, and perhaps of the world, at the precise moment when the old world would collapse. The Epstein emails did not talk about magic. They talked about mass management and the pre-positioning of elites in anticipation of a systemic shock. The proof was not theological: it was architectural.

VI. China: the silent architect of the great relocation

Beijing is the only capital that makes no eschatological claims. No “Storm is coming”, no political Ghayba, no Third Secret. But all the while, it is building. For twenty years, it has been constructing entire cities for populations that do not yet exist. Or rather: for populations who **will be displaced**.

The construction project of the century: 50 million empty homes

The official figures alone are staggering:

- **60 to 90 million empty homes** in mainland China (2020–2024 estimates)
- More than **450 “new towns”** (*xincheng*) built since 2000
- Cities designed for 1 to 5 million inhabitants but home to only a few tens of thousands
- A property vacancy rate exceeding **20 per cent** in some third-tier megacities

The Western media have long derided these “ghost towns” as evidence of an absurd economic model, based on property speculation and artificial GDP.

What if these cities were not economic failures, but pre-positioned shelters?

The new climate map of the Pole Shift

If the Earth’ s axis of rotation tilts —as predicted by Pole Shift models for February 2027 —the climatic geography will be entirely redrawn within a few hours:

Current region	Current latitude	New latitude (after tilt)	New climate
Central Siberia (Yakutia)	60–70°N	35–45°N	Temperate
Northern China (Manchuria, Inner Mongolia)	40–50°N	15–25°N	Temperate
Southern China (Guangdong, Guangxi)	20–25°N	–5 to +5°N (equator)	Arctic Circle
Hainan, Northern Vietnam	15–20°N	–15 to –10°N (southern hemisphere)	Polar Circle

Southern China, currently the country’ s economic and demographic heartland (the Pearl River Delta is home to over 80 million people), would find itself within the Antarctic Circle. The megacities of Guangzhou, Shenzhen and Hong Kong would become uninhabitable.

But northern China, on the other hand, would become temperate. Manchuria, Inner Mongolia and the Harbin region –all areas that are currently freezing in winter –would become the country’ s new fertile lands.

And where are most of China’ s ‘ghost towns’ located?

Exactly there:

- **Kangbashi / Ordos** (Inner Mongolia): designed for 1 million inhabitants
- **Zhengdong New District** (Henan): 100 km² of empty land
- **Kongdian** (Shenyang region, Manchuria): a ghost town since 2003
- **Yili, Changji, Shihezi** (Northern Xinjiang and Manchuria): oversized new towns
- **Chengdu Tianfu New Area**: a colossal expansion into the temperate west

The tell-tale signs

China has not merely focused on construction. It has **positioned its geopolitical pawns in advance** for the post-tipping-point era:

1. Siberian leases Since 2015, China has signed **49-year long-term leases** with Russia covering millions of hectares in Eastern Siberia (Transbaikalia, Primorsky Krai, Amur Oblast). Officially, these are for agricultural purposes.

2. The Arctic Silk Road China has officially declared itself an “Arctic-adjacent state” and is investing heavily in the **Northern Sea Route**. It is building icebreakers, funding Russian ports and training polar engineers. Why would a subtropical power take such an interest in the ice...unless it is to prepare for the day when that ice melts and Siberia becomes China’s new Riviera?

3. ‘Sponge Cities’ Since 2015, China has been rolling out the *Sponge Cities* programme to absorb floodwater. Thirty pilot cities, followed by an investment of 500 billion yuan. Officially, this is to tackle climate change.

4. The hidden census In 2020, China’s National Bureau of Statistics published population figures **revised downwards by 30 per cent** for certain southern provinces. Officially, this was a “methodological correction”. But these figures correspond exactly to projections of people abandoning areas that have become uninhabitable.

China: the only power that doesn’t lie

This is what makes Beijing the most organised player in this drama. Unlike Tehran, Washington, Rome and Paris, China is not preparing its people to **believe**. It is preparing them to **relocate**. When earthquakes shake Guangdong, when iron oxide dust blankets Shenzhen, the Chinese government will not need to invoke Article 16 or force majeure. It will simply say:

“Please proceed to your allocated city. Your accommodation awaits you.”

The “ghost towns” will fill up within a matter of weeks. The high-speed trains, if any remain, will transport hundreds of millions of people northwards, towards Manchuria and Siberia –leased for 49 years.

And France will still be debating the legality of postponing the elections.

VII. The Psychological Engineering of the Apocalypse

Tehran knows it. Washington knows it. Rome knows it. The Élysée knows it. Beijing knows it. They are not merely concealing deaths, absences, secrets or timetables. They are preparing for the pole shift, for they know that the material world is on the verge of falling apart.

By turning its leaders into phantoms in 2026, a year before the deadline, Tehran is pulling off a master-stroke: it is accustoming its population to believing without seeing. Meanwhile, Washington cries out “*The Storm is coming*”, the Vatican points SATAN towards the reddening skies, Paris locks down its electoral calendar to trigger a constitutional coup on D-Day, whilst China, ever-foresighted and pragmatic, organises shelters for its population.

Five regimes. Five narratives. One clock.

When, in February 2027, the stars dance and the Earth groans, there will be no further need for state television or White House press releases. The Jews will see in it the *Chevlei Mashiach*, Christians the Parousia, Shi’ites the return of the Mahdi, Catholics the fulfilment of the Third Secret of Fátima, the Pentagon survivors the fulfilment of “*The Storm*”, the French the legitimate application of Article 16 to crown the “master of the world” according to Epstein’s emails, whilst the Chinese will organise a mass exodus of millions of people northwards.

Each people will have their own interpretation. But all will experience the same collapse.

Conclusion: the rendezvous of February 2027

Humanity has entered a grey area where each people clings to its founding narratives to make sense of a coming event of biblical proportions in the literal sense of the term. The 9th-century Shia dogma, the truncated prophecy of Fatima, the expectation of the Messiah, the American obsession with the ‘Storm’, and the observation of a sky where iron oxide is spreading over Caracas and many other places —a sky that the Vatican observes through the eye of the VATT.

Meanwhile, Beijing is quietly building a monumental overcapacity of housing in empty cities.

And Isaiah provides the final key to understanding, the one that will give meaning to the collapse:

‘The whole host of heaven shall be dissolved; the heavens shall be rolled up like a scroll, and all their host shall wither away.’ —Isaiah 34:4

“For I am going to create new heavens and a new earth; the former things will not be remembered.” —Isaiah 65:17

This Pole Shift is not the first; periodically, every 3,660 years, the earth undergoes this upheaval, of which all ancient traditions have preserved a record. All the timekeepers of global geopolitics have synchronised their watches.

End of note.

THE POLE SHIFT, A WILD RIDE

Given that Planet X is near the Sun and creeping toward us on a path that will take it over our heads during its passage, what can mankind expect? What will a pole shift bring?

Man has survived these shift in the past, and will survive this one. ZetaTalk has discussed, in detail, what steps to take to survive the shift itself and to prepare for life afterwards. The Safe Locations section of ZetaTalk, on the web, is available for free and as a downloadable PDF readable by Adobe Reader, also free to the public. The Troubled Times nonprofit has prepared information available to the public at cost, A CD twinset and booklet, but this information is also available for free on the web. It takes a brave heart to listen to a description of the coming pole shift, But all described here can be survived. Nor does survival cost money, as laying in a trench to avoid being tossed about during earthquakes and flying debris during high winds is as accessible to the poor as it is to the rich. The rich will fare no better, in fact, are more likely to cling to their toys and be crushed to death in their mansions.

The pole shift will certainly not take mankind by surprise, as it is preceded by 3 days of darkness and 6 days of sunrise West in the northern hemisphere. These gyrations of the Earth are caused by the near proximity of Planet X, itself, as Earth, a giant magnet, as it points it' s North Pole toward us, pushing our North Pole away.

ZetaTalk: 3 Days of Darkness, written Sep 30, 2004

Planet X seeks to align along the tight magnetic flow lines just under the Ecliptic to the tight magnetic flow lines just above the Ecliptic, which have radically different alignment dictates. Under the Ecliptic, the flow lines are returning magnetic particles to the Sun, but above, they represent an outward bound stream, which does not tolerate a N. Pole pointed toward it. Planet X must roll, and does this as a sideways roll, the path of least resistance, then rising its N. Pole to align side-by-side with the Sun.

The Earth is hardly a passive observer, but participates when it finds a hose of magnetic particles pointed at it by deflecting its N. Pole. This is reflected in folklore as a period of darkness for the northern hemisphere, a Biblical prediction of 3 days of darkness, which is not the week of rotation stoppage. As the Earth continues to roll, in synch with Planet X, keeping its N. Pole pointed away, the Earth is unmistakably turned sideways, again well documented in folklore. All those complicated descriptions of magnetic poles and flow lines. Remember when as a child you played with iron ore flakes on a plate of glass, a magnet underneath the glass? Tap the glass and the particles made circles on either side of the bar magnet, lining up with the magnetic field as it emerged from the N Pole and returned round to the S Pole. If you tried to put the N Poles of two magnets together, they resisted, and the same with two S Poles, but if you lined them up end to end, they snapped together. They would also snap together side by side. Both Planet X and the Earth are such magnets, but are not allowed to touch each other as the anti-gravity force keeps them apart. The anti-gravity force is actually an outbound surge of gravity particles from the center of a planet, and it' s what keeps our Moon up there, so very huge and moving so very slowly. This is not centrifugal force keeping the Moon up, it' s the anti-gravity force.

This twisting and turning are NOT the pole shift, not yet, and are followed closely by the rotation of the Earth slowing to a stop for 5.9 days. This is due to the tendency of the deep rift running N/S the length of the Atlantic Ocean to act as a surface magnet. This rift is gripped, which causes the stopped rotation.

ZetaTalk: Stop Rotation, written July 15, 1995

Planet X outweighs the Earth by some 23 times. Should one line these planets up side by side, the Earth would look to Planet X as the Moon does to the Earth. In the tug of war regarding Magnetic Alignment Planet X' s mass gives it a 4-to-1 advantage. There is no contest.

The Earth slows in its rotation, and actually stops. This is recorded in written history and spoken folklore, worldwide, as a long day or night. The period of time, due to the lack of mechanical clocks, was not measurable, but the humans who experienced this described this as anywhere from a few hours to several days. The latter is more correct.

Rotation stops because Planet X has essentially gripped the Earth. While at some distance from the point of passage, it has gripped Earth to the point of not letting the highly magnetized Atlantic Rift go. During this week, the size of the approaching Planet X horrifies those on the daylight side of the Earth.

At first a reddish blob only a fraction of the size of the Moon, it grows in size and appears to twist and turn like a dragon in the sky. The ancients recorded this as a fire dragon in the sky, as the tail of swirling moons gave this appearance. The first sign, during this period of twisting and turning and slowing and most likely preceding it, is a fine red dust.

ZetaTalk: Red Dust, written Jan 11, 2003

The red dust cloud evolved as many planets in the solar system are heavy in this element, Mars, for instance. There are portions of the Earth that exhibit a red clay soil, Australia and the Southeastern US, but this is not a native soil as much as an accumulation of deposits.

During the breakup of the Asteroid Belt, many planets that had this element, heavily, were pelted to pieces. Molten lava spewed into space became the asteroids. Iron ore is magnetically configured to pull out of any soup it is free to move within, and does so particularly in space.

Thus, the dust, during poofing off into space during demolition derby' s as Planet X and its complex of Moons moved through what is now the Asteroid Belt, moved, and became part of the Planet X tail. Planet X, like a big magnet, swept through the area during the poofing phase, and emerged with a larger dust cloud, each time. Some evidence of this red dust appeared on Earth in 2003, and since. This is discounted in the news as coming from the Sahara, all the way, supposedly, to the Gulf of Mexico, where such dust storms were never reported before. Deposits in bird baths and on patio furniture, unmistakably iron oxide particles, very blood red. But these very early signs of red dust in our atmosphere are NOT the heavy dusting that will turn the rivers blood red, as legend reports and prophecy predicts, during the days preceding the pole shift.

ZetaTalk: Warning, written Dec 15, 2001

Folklore stands as a guide as to what can be expected during the hours preceding the shift, and the shift itself. The tail of Planet X streams outward from the Sun, pushed there by the solar wind. Thus, it does not sweep the Earth until Planet X is positioned exactly between the Earth and Sun, a short moment in time.

During the time of the Jewish Exodus, it was reported that Moses was able to turn the waters of the Nile red, with his staff. Of course, this was the red dust in the tail doing this, but having been forewarned that the moment was upon them, Moses took advantage. Thus, one can see from folklore that the tail dusting

was in effect before the shift. It is only the tip of the huge tail that reaches Earth at first, composed mainly of fine dust and debris that result in meteor showers and fireballs on Earth. But just as we have had signs of fine red dust in the atmosphere since 2003, we have also had increased fireballs screaming to Earth, meteors thudding down next to startled housewives hanging the laundry. During the week of rotation stoppage more than red dust enters the Earth's atmosphere, increased fireball and meteor activity also occurs, as the tail is full of rocks. Hailstorms occur.

ZetaTalk: Warning, written Dec 15, 2001

The tail sweep includes first the red dust, most likely to be in a cloud around the tail, then heavier gravel, then lastly boulders. Gravel is defined in folklore as hail stones, which can injure homes and humans and animals alike caught under such a deluge.

Boulders cannot be defended against, but are rare. Like a meteor dropping from the sky, should one land upon you, your next incarnation is at hand! Thus, dusting with red dust should be considered a warning to take cover, under metal or sod roof structures, out of the wind. The shift cannot be more than a few hours away.

The dusting with red dust occurs less than 24 hours, and most likely less than 12 hours, before the shift. This depends upon a number of factors, including how well the dust drops through the atmosphere to be deposited on land. In one location, the first sign of dust may be 18 hours ahead of the shift, and all run in panic to shelters. In another location, dust may not be noticed until heavy, perhaps 6 hours ahead of the shift, a good time to head for the shelters in any case.

The tail sweep will then proceed from red dust to hail stones just ahead of the shift. A normal roof would protect from the hail stones, which will be like the hail experienced during violent windstorms, where hail of ice falls and ruins crops. What to do during the hail storms? The Zetas have some advice.

ZetaTalk: Comet's Tail, written July 15, 1995

It is reported in folklore that hail stones, gravel, lashes the Earth. During the last passage the reports stated that crops and small trees were utterly destroyed by these hail storms.

The best defense for humans is to huddle near cliffs, out of the wind, not in open fields, as most missiles that crash to Earth, large boulders, will not drop straight down! They come in at an angle, and will glance off hilltops, bouncing about. Thus, those in ravines are unlikely to experience a direct hit.

Those who would escape the wicked lick of this tail are advised to take shelter against cliffs, in caves, in valleys, or under metal roofs. Its passage is swift, a matter of days, and the ending abrupt. Where is could be assumed that the side of the Earth facing Planet X would get wiped by the tail, The tail in fact curls around the Earth.

ZetaTalk: Red Dust, written Jan 11, 2003

All parts of the globe report debris, China as well as Egypt, in the past. The tail streams behind Planet X, and is involved in swirling motions as the Moons have a dance between themselves. A tail swirl, moving like a slow moving tornado, approaches Earth which has magnetic as well as gravity attraction. Thus, it is not simply a head-on hit, tail to Earth, as it is also a sideways hit from swirling matter coming from this or that side.

Then there is the motion of a tail swirl being curled toward Earth, continuing the curl. Like a whip that curls around what it is thrown against, the tail can wrap all around the Earth during such a lick. There are no parts of the globe that do not report red dust, frankly. It is perhaps more extreme on those sides of the globe that will be facing the approach, but elsewhere is not exempt. Lashed by the tail, the Earth's atmosphere is somewhat stripped away, creating more problems as debris is less likely to burn up during a fall to Earth than when oxygen is available to create the burn. The tail has component that can form into petrochemicals, the origin of the oil deposits on Earth, as when the tail passes over volcanoes the heat there CREATES these petrochemicals. This is reported in legends, near volcanoes as along the West Coast of North America and lands East of the Mediterranean, that walls of fire fell from the sky. This is the reason for the ZetaTalk advice to lay in a trench covered by either a metal or sod covered roof at ground level. This protects from such fire storms.

ZetaTalk: Firestorms, written July 15, 1995

Petrocarbons are in essence created, due to the flashes of lightning and intense heat due to passage over open volcanoes, and these petrocarbons rain down, afire, at times. With the atmosphere scattered, chemicals in the comet's tail similar to your petrol chemicals do not flash in a quick consummation into water and carbon dioxide, but descend close to the surface of the Earth before bursting into flame.

A fire storm, killing all beneath it. All this has been reported in ancient times, as humans observed accompaniments to the cataclysms.

Mankind presumes that oil came from compressed and trapped vegetation, eons ago, but cannot duplicate this process. Why would vegetation result in oil, deep underground, when the process only results in methane and compost today? Petrochemicals are broken down by cracking, during the refinement process, and are thus sensitive to heat process.

This is how they were created, in the first place! During the shift, so much is roiled about in the atmosphere, and so many volcanoes erupting, super hot air overhead, that binding occurs. This is evident in the recent Papua New Guinea oily substance found following a volcanic eruption, which man had no explanation for! What about freezing and frying during the week of rotation stoppage? Would this not occur? Per the Zetas, the oceans and atmosphere are not stopped, and these act as cooling and heating influences.

ZetaTalk: Warning, written Dec 15, 2001

During the week of rotation stoppage, the normal heating and cooling that occurs during rotation stops. This means that the day side of the Earth warms up without cooling, and likewise the night side cools down without warming up under sunlight the next day. Where does this lead, in a week? Will one side of the Earth cook, while the other freezes?

Folklore likewise tells mankind that such a situation does not occur, as there are survivors, and these survivors do not relay such problems. In fact, due to the atmosphere moving about, hot air rising and cool air dropping, as usual, there is exchange of heat and cold, even without rotation.

Thus, those in the day side will find it may be as hot as a very hot summer day, but no worse. And those in the night side may find they need to break out the blankets and turn on the furnace or start a fire, as in winter, but no worse than this. During rotation stoppage, the Earth also groans and moans, as the core wants to continue turning, and pulls in that direction, which the crust insists it must stop.

ZetaTalk: Groaning, written on Feb 15, 1999

As the passage nears, during that day, the Earth will begin to groan and moan, resisting yet inclined to shift. The moaning of the Earth is akin to material snapping, screeching rock strata pulling across other strata, and vibrations of rock strata under tension.

Many sensitive people report becoming ill prior to earthquakes due to similar vibrations, not particularly heard, but felt by the body in any case. In similar manner, many more humans will feel ill during the week of rotation stoppage, and not just due to the stress of the moment, but due to vibrations in the underlying rock strata.

Pressure on rock results in more than motion or noise. It has been reported that pending quakes can be sensed by radio, as static on the radio increases just prior to a quake, by hours or days. Rock strata, under pressure, changes the emissions, electrons, magnetic fields, and other subatomic particle flows. Pets likewise get up and move about, sensing something, as do farm animals.

No motion or shifting of the crust happens until a threshold is reached, and thus the week of rotation stoppage, with increasing groaning and moaning of the Earth until the snap and shift. But until the actual shift, the tension is sustained, and the Earth groans in her agony. Brilliant displays of lightning occur, high in the heavens, flashing between the Earth and the passing Planet X.

ZetaTalk: Lightning Bolts, written July 15, 1995

Static electricity in the atmosphere will not increase during the approach of Planet X, nor afterwards, but during the passage lightning will seem to be almost constant in some places. Humans are familiar with arcing, where two poles or points are electrified, carrying an electric current, and suddenly the air between them is filled with a minor lightning bolt - zap.

What allows lightning to find its path? It is using a little understood path formed by sub-atomic particles, electrical waves of a sort, that have not been measured yet by Earth's human scientists. These emanate from any highly electrified field, and when they touch the arc is now possible.

The path between the Earth and its passing brother, Planet X, will be so electrified at points, and static electricity accumulates. This would be devastating to the Earth if the static electricity had accumulated on the passing Planet X, a monster compared to the Earth, but the opposite is the case. The static electricity passes from the Earth to her brother, and causes fantastic lightning displays in his upper atmosphere.

This period when static electricity can pass is brief, a few hours, and occurs when the Earth's inhabitants are, essentially, fighting for their lives, so they barely take notice. How does a lightning bolt pass some 14 million miles across space? It doesn't, not in that form.

In space, not having water vapor and other particles to interact with, there is no spontaneous release of light and heat, no flash and crackle, just the passage of electric particles in all the various sub-atomic components that comprise an electrical current. 14 million miles from Earth? That close? Planet X will pass overhead at an angle, such that it moves from being exactly between the Earth and Sun to crossing overhead. It is during this passage overhead that a pole shift is effected, as the North Pole of Earth is pushed away, the South Pole of Earth pulled up, and the Earth tipped in space.

Planet X had been pointing its North Pole at the Sun's South Pole, then moved upright during the week it was directly between the Earth and Sun, that week of rotation stoppage, then must twist again to point its North Pole away from the Sun. It is during this second twist that the Earth is tossed about.

This sudden movement of the core of the Earth, dragging the crust with it, takes place in the span of an hour, the hour of the shift.

ZetaTalk: Pole Shift, written prior to July 15, 1995

You are aware that your Earth is heavier at its molten core, which is rumored to be composed primarily of iron. This is not entirely untrue, but regardless of the composition, the Earth's core is more sensitive to the magnetic alignment than the crust. The core grips the crust, and is not as liquid as one might think. There is friction. There is the tendency for the whole to move as one, despite their differing magnetic allegiances.

The pole shift is in fact a movement of the interior of the Earth, the core, to come into alignment with the passing Planet X, which due to its massive size in comparison to the Earth, dominates the magnetic scene.

The Earth's crust resists, being caught in a web of magnetic pulls from its immediate neighborhood. In other words, the Earth's crust wants to stay with the old, established, magnetic pull, while the core of the Earth, having less allegiance and attachment to the neighborhood, listens to the passing Planet X.

There is a great deal of tension that builds between the crust of the Earth and the core of the Earth. This tension is released when the core of the Earth breaks with the crust, and moves. However, the core of the Earth drags the crust with it as it turns to remain in alignment with the passing Planet X.

The pole shift is therefore sudden, taking place in what seems to be minutes to humans involved in the drama, but which actually takes place during the better part of an hour. There are stages, between which the human spectators, in shock, are numb. At first there is a vibration of sorts, a jiggling, as the crust separates in various places from the core. Then there is a Slide, where the crust is dragged, over minutes, to a new location, along with the core.

During the slide, tidal waves move over the Earth along the coast lines, as the water is not attached and can move independently. The water tends to stay where it is, the crust moving under it, essentially. When the core finds itself aligned, it churns about somewhat, settling, but the crust, more solid and in motion, proceeds on. This is in fact where mountain building and massive earthquakes occur, just as car crashes do their damage on the point of impact, when motion must stop.

Weak spots among the Earth's crustal plates give way. The Pacific Ocean will shorten, and the Atlantic widen. Subducting plates will subduct greatly. Mountain building will occur suddenly, primarily increasing in areas already undergoing mountain building. All told, the better part of an hour, but at certain stages, only minutes.

Plants survive as they are rooted and their seeds are everywhere, and animals including man survive because they travel with the moving plates of the Earth and experience no more severe a shock when the plates stop moving than they would during a Richter 9 earthquake.

Where mountain building occurs when the plates stop moving, the stoppage is not simply a sudden jolt, like a car hitting a brick wall. All is in motion, and the stoppage is more like a car hitting a barrier of sand filled plastic barrels - a series of small jolts, occurring in quick succession.

At this time we estimate that Planet X will come to within 14 million miles of the Earth. The strength of its magnetic field at that distance will be such that the North Pole of Planet X, angled essentially in the same direction as the Earth's North Pole, forces the Earth's North Pole to evade the pressure and accommodate its larger brother by swinging south to the bulge of Brazil. As the Earth is moving UNDER the blanket of the Earth's atmosphere, hurricane force winds, worldwide, occur during this hour.

ZetaTalk: Violent Winds, written on Jan 15, 1996.

At the shift, the surface of the Earth will move, in just under an hour, more than a quarter turn. Where massive earthquakes and tidal waves occur when this motion stops, Hurricane Force winds, world wide, occur during this shift.

During the shift, the atmosphere of the Earth does several things, all at once.

- It drags along with the Earth. Do not the waters in your oceans move with the Earth as it turns? The atmosphere is an ocean too, just lighter and therefore more mobile.
- It moves as a mass, pushing on air in other places and likewise, itself being pushed. Thus, even in those places on the Earth which are not moving, during the shift, being pivot points, the air is turbulent.
- It swirls, as circular motion in air masses is the response to conflicting forces, as seen in the circular motion of tornadoes and hurricanes.

Yes, the atmosphere is in motion, and yes, the whipping and confused winds might reach hurricane force during this hour and be unpredictable for several hours after the shift, but one should not assume a force of winds above what the world experiences today.

Your hurricanes and typhoons represent what occurs when air masses attempt to move against each other, given their density and gravity attraction and inertia. These same factors are in place, are predominant, during the pole shift. Humans wishing to prepare for these violent winds should anticipate a force equal to their familiar hurricanes, not tornado force, although tornadoes will be spawned. Stay below the Earth's surface, lie low, and tie down everything you wish to find when it's over. Earthquakes do not occur during the shift, but occur when the shift stops. As the saying goes, it's not the fall that hurt, it was the sudden stop. These earthquakes will be like a Richter 9 worldwide, but because quakes are measured by scope affected as well as force, the Zetas have described these as Richter 15.

ZetaTalk: Earthquakes, written on Dec 15, 1997

During the pole shift all plates on earth on the move, and the jolt occurs at the sudden stop when the crust stops moving. This is when the Richter 9 equivalent earthquakes, which we have termed Richter 15 as the scope is far larger than Richter 9, and will be felt worldwide.

The earthquakes following the pole shift will be no more wrenching than earthquakes due to plate adjustments under normal circumstances. The moving plates, suddenly slamming into each other as they start to slow down, will create a domino effect not unlike a multiple car crash.

One plate slams into another as the first plates slows down, creating a domino effect that rapidly ricochets around the world, within minutes. There is no delay in this motion, as each plate is solid and what affect one edge affects the far edge, when the entire plate is in motion. Thus, the earthquakes come all at once, and rapidly settle down to an adjustment phase, within minutes.

Due to the immensity of the adjustment, with many plates in barely tenable positions, there will be many aftershocks, most occurring within the first few weeks. These will range from Richter 8 on down, but in no case will be as great as the initial shock during the pole shift. They will rapidly diminish, reduced to annoying tremors after a few weeks. Of course, during such upheaval, volcanoes will explode. Per ZetaTalk, any volcano active during the past 10,000 years should be anticipated to explode.

ZetaTalk: Volcanoes, written on Feb 15, 2000

Of course all volcanoes will explode, as this is going to be a very severe pole shift. What about the months and years preceding the pole shift? All volcanoes that have been active within the memory of man will begin spewing and burping and oozing, and many that were not expected to become active will reactive.

How long will it take the volcanoes to settle down? 100 years, but in a reducing ratio, over this time. By the end of 100 years, their activity will seem as today. Nevertheless, for those downwind, this post shift burping is virtually a death sentence!

We have stated that all volcanoes active within the last 10,000 years can be considered candidates to blow, or ooze during the shift. During every pole shift, there are places on Earth where the earth is stretched, like the Atlantic, such that mountain ranges such as the Appalachians have not experienced mountain building and scarcely any rock outcropping are bare.

Places like the Himalayas are subducting, so that rock layers are being laid under one another, and protection from the lava occurs. Hawaii, likewise, is expected to do better than one would think, because the compression of the Pacific will layer rock strata and protect the oozing volcanoes from roiling lava.

In New Zealand, where that edge of the plate will tip up, it will be some protection from exploding volcanoes as the pressure will be relieved. Likewise, where there is a stretch, as Iceland will experience, there will be continued oozing, but explosions caused by lava under pressure unlikely to happen.

In areas under stretch in Europe and the Middle East, the roiling will cause oozing and where volcanoes are already open to the air, an outlet established, such as in Italy, they will continue during the early part of the shift to explode and ooze. Per the Zetas, Yellowstone will not become a supervolcano.

ZetaTalk: Yellowstone, written Dec 5, 2003

The eruption will not be what many fear. It has evidence of being a super volcano at a time when the world was in complete global turmoil, not due to a pole shifts but due to impacts and being careened out of its orbit and closer to the Sun. The injury to the crust so deep it almost reached the core. So clearly that was an exceptional situation, not this situation.

What should be born in mind is that this is a subduction area, with layers of the North American Plate pushing all the way to the Continental Divide. Even though Yellowstone lies in an area which is a hot spot, there' s enough crust flakes overlapping that it is not just a direct siphon of lava to go kaboom in an explosion.

But it will cause ash for some 100 miles in all direction, bad enough that life may be snuffed in those areas. So we would recommend anyone wanting to survive the shift itself, not to be close to Yellowstone but to allow a 100 miles buffer, more miles would be better. During the violent earthquakes that accompany this shift, mountain building occurs.

ZetaTalk: Mountain Building, written on May 15, 1999

Mountain Building occurs during rapid subduction of one plate under another. There is friction between the plates, so that crinkling of the upper plate occurs. This crinkling represents pressure and release, which can result in violent jerking and upheavals, sometimes snapping to create new cliffs or jutting rock.

Mountains and valleys have likewise been formed because of crumpling, horizontal pressure, and this will happen again during the forthcoming shift. What happens to rock when it is asked to compress, to fold? It breaks, and moves into the point of least resistance which is upward into the air. Thus, jutting peaks of sheer rock with the rock strata going almost vertical occur.

It crumbles, with a jumble of rock rolling over each other as the mass is pushed upward. Thus, anyone or anything on top of that spot will be subject to being ground up in the tumbling process. Compressed rock can also drive horizontally, into nearby soil or space not occupied by anything as dense as itself.

Thus, those in a valley can find rock shooting out of a hillside, or rock spears shooting under their feet, unexpectedly. Surviving the mountain building process while in the mountains is precarious, and not advised.

This time around, there will be strong mountain building, in particular in the Hymalayas and Andes, not so much along the West Coast of North American, and hardly at all in the Alps in Europe. There will be new land rising from the waves, and some land sinking beneath the waves.

ZetaTalk: Sinking or Rising, written on Jun 15, 1997

Periodically during severe pole shifts, land rises or drops, sometimes moving under the waves. Likewise, land long under the sea can suddenly pop up, presenting gasping and dying sea life and deep muck that eventually dries to form new and very fertile soil.

Continents pulled apart, as in the steadily widening St. Lawrence Seaway or African Rift, can cause land along the perimeter to rise, as the stretch over the curvature of the Earth has been removed, so that the natural buoyancy or shape of the land can take effect.

New land will emerge near Antarctica between the tip of Africa and South America due to pressure against the western coast of South America. Due to the strength of the Antarctic plate, this pressure will be relieved by allowing the Antarctic plate to ride over the bordering plates in the Atlantic. The pole shift proceeds in a predictable fashion, the existing structure of the crust scripting this drama. The grip on the Atlantic Rift, so evident in the global quake signatures, shows where this drama will start, how the continents tear apart during the hour of the pole shift. The Earth is ALREADY pulling East from the Atlantic Rift, and piling up behind the Atlantic Rift from the rear, in the West. There is ALREADY stress on the plate jamming under India, and popping up near New Zealand. The North American continent is ALREADY nailed at Alaska and sliding into the Pacific in Central America, causing Florida and the SE to sink as it has less support from the edges of the Atlantic Rift, near the opening jaw. The South American continent is ALREADY likewise nailed at Argentina and sliding into the Pacific near Central America, causing the ripping of the South American continent near Buenos Aires. The African continent is ALREADY nailed at South Africa and pulling East at the top, ripping apart the great African Rift in Kenya and surrounding countries.

ZetaTalk: Scripted Drama, written on Apr 15, 2002

The stage having been set, then, the crust movement during the hour of the shift is as follows:

1 As the South Pole, gripped by the passing North Pole of Planet X, moves north, the crust is torn from the core and freed in this way, allows pre-existing stress points to relax. Thus, Europe and Africa move further east, allowing the Atlantic to rip apart, during the slide northward.

2 The immediate affect of the massive plate housing Europe and Russia and the Near East to move is felt most strongly in India, as the Himalayas are driven over India at this point, effectively sumerging this country in a wink.

3 The effect of the Indio-Australian plate taking a dive under the Himalayas is to relieve tension along the African rift, such that this tears, promptly, but in shuddering steps with halting adjustments pauses between shudders. In essence, the movement eastward of the African continent is a momentum creating this tear.

4 During the tearing of the Atlantic, and the dragging north or the North American continent, an already existing tear in the St. Lawrence Seaway tears further, essentially the weak link in this landmass held at so many points to the further side of the Atlantic. Canada move north, while the rest of the Americas cling to the Atlantic Rift while it separates.

5 The movement of the massive plate housing Europe, Russia, and Asia to the east also is expected to rip this plate along the Himalayas, as we have stated, creating an inland bay into the Russian lands just to what is now the north of the Himalayas. This follows, in jerks and tears, over the hour of the shift, along with the tearing of the African rift.

6 When the ocean off the Bulge of Brazil has reached the position of the current North Pole, crust slippage stops, creating yet another drama. The major northern hemisphere plates stop, and whatever follows crashes into them. In the case of the America's, this causes Central America and the Caribbean to crumble.

7 In the case of Africa, already sliding eastward, the force is further movement eastward, as subduction of the Indio-Australian plate has already begun, the weaker link already established and momentum in process.

8 The pile-up is in what was the former northern hemisphere, and the compression of the Pacific is creating resistance as plates are subducted under the Americas and Japan explodes and Indonesia crumbles.

9 This frees the plates south of the tips of South America and Africa of stress. As the Pacific adjusts, reluctantly, pressure toward Antarctica, the one place on the globe not experiencing plate pressure, allows new land to pop up between the tips of South America and Africa. As the Earth moves under the oceans, tidal waves roll inland first on one side of the ocean, then as sloshing occurs, over the other side.

ZetaTalk: Tidal Waves, written prior to July 15, 1995

As great as the danger that earthquakes bring, greater still is the devastation that the shifting waters will bring. Thus the waters slosh over the nearby land, in the direction opposite to the shift. As with the hurricane force winds, which will likewise push in the opposite direction of the shift, this can be computed. I live in Wisconsin, and as the Bulge of Brazil will be dragged up to where the North Pole is currently, I expect my winds to come from the NW. This same logic can be applied elsewhere around the globe, for both wind and water.

ZetaTalk: Flood Tide, written Jun 15, 2001

As anyone carrying a saucer of soup knows, the soup and the saucer do not always move as one. If the saucer moves suddenly, the soup may stay behind, slopping. What happens to oceans which are thus lifted out of their beds, and pushed up over land higher than that from which they came?

It is a flood tide, as the oceans are climbing out of their beds, into higher ground, so the leading edge is the highest point of the wave. During a pole shift the ocean as a whole is on the move because it stays behind while the crust moves, and thus rolls up on land onto the coastline being pulled under it.

This is a flood tide, with the lip of the water being its highest point, rising like a silent tide endlessly on the rise, the wave rolling inland without a crashing back and forth, just a steady progressive inundation. To those at the mercy of such a flood tide, their first thought is to climb above the tide.

Soon they are standing on the highest point they can reach, and still the water, flowing inland steadily, rises. Afloat on a boat or flotsam, they will be dragged inland with the flow until a reverse slosh begins, the water flowing back into its bed.

But in the nature of water during a slosh, overshooting this other side so that both sides of the ocean experience this flood tide, alternately, for some days until the momentum diminishes. When the flood tide recedes, those afloat are in danger of being dragged far out to sea with the flow, as the water will rush to its bed unevenly, more rapidly where it can recede the fastest.

Whale bones on mountain tops well inland were not lifted by Tsunami waves, nor carried inland atop such a wave. A whale would not be close enough to the shore to be caught in such an occurrence. They arrived at these inland mountain tops because the entire ocean was moving, and they could not escape the momentum.

Thus caught, they were deposited in rocky crags where fast flowing waters moved quickly away from them through cracks, too tight a squeeze for the hapless whale left floundering behind. The hour of the shift can be determined in a number of ways. The Sun and Moon and stars will be suddenly on the move, moving steadily and swiftly. For those under cloud cover, there are other clues, a jiggling sensation, the wind picking up simultaneously.

ZetaTalk: How to Identify, written May 10, 2003

For those not able to see the sky, to gauge motion of the crust during the hour of the shift by a movement of the Sun or Moon or stars, they should at this point be in their trenches, virtually living there. Obviously, as the shift takes place over an hour, and it is the stop of the crust slide where the huge quakes occur, one can leave to relieve themselves or stretch, but certainly sleeping should be done in the trenches.

At the start of the shift, there is a strong clue that crust shift has started, and this is the uptick in wind. As the crust moves, the atmosphere resists, and this causes hurricane force winds globally. It will come from the direction the crust is moving. For North America, for instance, the crust will be moving NW, and the hurricane winds comes from that direction.

There will also be a jiggling in the Earth, a sense of motion, jerking, that will be consistent with crust movement during this hour of the shift.

The hurricane force winds persist for an hour or more after the shift, as the atmosphere adjusts. Except as a caution to watch for falling structures around you, broken glass, fearful animals that might attack if they feel they are blocked, there is no reason not to emerge from your trenches. It is over, and picking up the pieces and comforting the injured and devastated can start. For everyone, worldwide, this will be a most terrible day.

ZetaTalk: Most Terrible Day, written on Jul 15, 1996

For most, it will be a most terrible day.

Those who have had no forewarning will be no worse off than those who have heard rumors but been unable to make changes in their life to prepare. In fact, having no forewarning will almost be a blessing for those unable to prepare, as in this way they will not agonize over choices made.

Those who have prepared will be in a state of high anxiety, imagining the worst. Regardless of whether a human realizes what is about to happen but has been unable to take themselves to safety, or has no realization, the effect is the same. They wait for what is to come next.

This waiting can take the form of distractions such as parties or denial such as continuing with the daily routine as though everything were normal, but for most this waiting is a type of breath holding. They are in shock, from the time they realize that the Earth has stopped rotating until the pole shift, they are essentially in shock, for days.

For those along coast lines, the hour when the Earth's crust moves along with the core to its new position is not the time of trauma until the Earth's core and crust stop. It is then that massive tidal waves roll slowly up into the coastal areas, first on one side of a body of water and then, later when the water sloshes back, on the other side.

Both tides are equally as devastating. Being on high ground along a coast line is no safety factor if the water has nowhere to go, as the press of water behind the wave head will force the water up when meeting a barrier, so one is flooded anyway.

Riding the wave results in being dashed against barriers, and allowing the wave to engulf one is a certain drowning, fortunately a painless death. Thus, those along the coast lines die from tidal waves, almost invariably, if they are not dead already.

For those inland beyond the reach of tidal waves, the earthquakes are devastating. All but the flimsiest of housing is wrenched so violently that it collapses, crushing and trapping those inside. Those inside tents or straw huts will find themselves, along with their housing, jerked sideways, but aside from scrapes and bruises, relatively unharmed.

Lying on the ground during this time is in and of itself a protection, as friction along the ground prevents one from being hurled. In the cities, structures collapse, creating the scenario seen after major earthquakes in the extreme, everywhere.

The injured die from lack of treatment and the living soon sicken from drinking sewage contaminated water, and with transportation blocked on all sides, starvation soon takes its toll also.

Those living on subducting plates that border the oceans, such as India and western Australia, will find themselves covered with a depth of ocean water that they cannot resist. They will surely drown.

Those situated where rapid subduction occurs on areas above sea level may themselves on hot earth during the moments following a pole shift when the crust stops moving and the plates in essence slam into each other like a train whose engine suddenly comes to a stop.

Here height helps, as the greater the distance from where friction between the crusts is creating heat, the better. The heat can be great enough to melt rock, as witnesses who have survived such terrifying sights attest.

Volcanoes, active and inactive, will explode violently, covering the surrounding areas in raining rock and dust and superheating the air so that all life nearby is extinguished in a wink.

Lightning and firestorms from falling walls of flaming petrochemicals, formed during the interaction of gasses with volcanic heat and continuous lightning, cannot be predicted. They can happen world wide, and as with the hurricane force winds are a factor of the atmosphere, not the land mass.

Where they are rare, these firestorms are devastating, and burn all beneath the falling wall of flame in a holocaust. The horrified victims have little chance to even realize what is happening before they are engulfed and lose consciousness from lack of oxygen.

As with spontaneous human combustion, the victim is unconscious during the burning process. Protection from this rare chance of devastation is best attained by sheltering under a metal roof, which will not burn.

In rural areas survivors find themselves dealing less with the collapse of civilization than with climate changes. At first, stores are eaten until gone, and then real concern about the inability to grow crops sets in. Will the Sun never shine through the clouds?

More than any other reason, this is what causes pole shift survivors to wander - they are seeking a land where the sun shines as it used to, sure that they are simply on the wrong side of the Earth for some reason. Starvation soon has survivors eating everything in sight, chewing on old leather, eating the branches of dead trees, but still the gnawing hunger continues.

Death by starvation is also relatively painless, as a stupor sets in. The mind is dulled and languor envelopes the human, who is essentially asleep when death comes. The result is a new geography and a new climate, worldwide.

ZetaTalk: New Geography, written July 15, 1995

After the pole shift the Earth begins rotating again. Whatever part of the Earth is North, magnetically, after the shift, will become the new North Pole. The pole shift, with consequent realignment of the poles, will place the New Equator over formerly frozen lands.

Greenland, Canada, Alaska, Siberia, and Europe will be affected by the new equator. Past cataclysms have regularly rearranged the Earth's geography and climate zones, as the Earth attests. After a pole shift the former poles invariably melt and soften while the new poles take on layer after layer of ice and snow.

In the meantime the Waters Rise worldwide, several hundred feet, and then recede again. This pace is gradual, so that coastal settlements have plenty of time to relocate, an exercise they find they must do repeatedly. And the Earth will experience a rebirth.

ZetaTalk: Rebirth, written July 15, 1995

The Earth of the future will clear up. The Earth's population will reduce by 90%. Polluting practices, such as burning oil and chemical additives, will essentially stop.
